

Abstract of the Disclosure

A stroller with a basket comprises a backrest, a seat, a frame assembly, a basket, and a plurality of wheels. The frame assembly includes an U-shaped handlebar, two first rods and two second rods, connected with each other. The frame assembly further includes two first blocks respectively fixed to both second rods. The basket has a basket frame, a basket body attached to the basket frame, and two second blocks respectively secured to both sides of the basket frame. The basket frame can be formed by two rod telescopically coupled with each other or alternatively by bending a flexible rod. When the second block is supported on the first block, the basket is spread out and the distance between the basket frame and the seat is smaller. When the second block is separated from the first block or located beneath the first block, the basket can be descended so that the distance between the basket frame and the seat is larger in favor of putting the articles into and taking the articles from the basket.
